Start in ChatPlace

Red circles show the controls to click.

Before you start

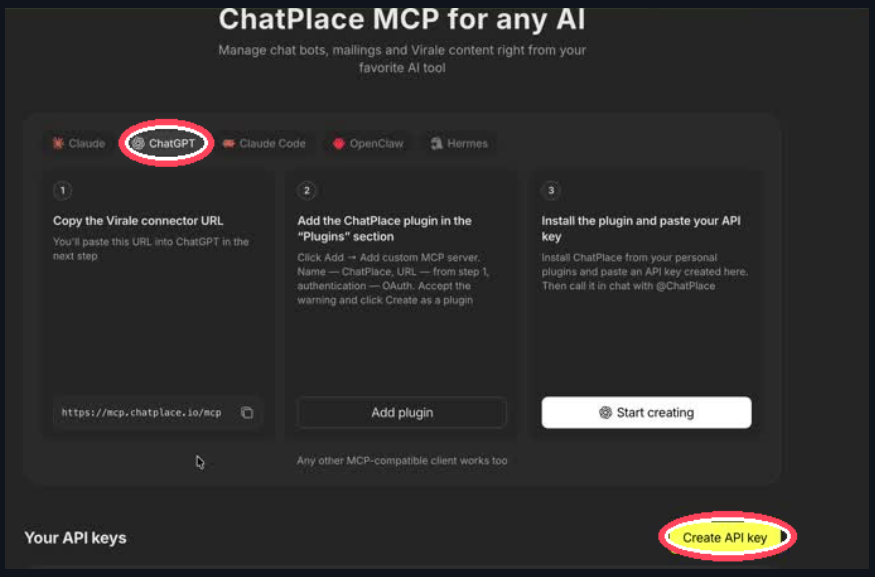

Use a professional Instagram account (Creator or Business), connected to ChatPlace. MCP access and custom connector availability depend on your plan and workspace.

1. Open ChatPlace and go to Virale. Click MCP connector in the left sidebar.

If Instagram is not connected yet, open Automations → Accounts and follow the Instagram connection flow first. Masha already has her account connected in the recording.

2. Choose ChatGPT (or Claude), then click Create API Key.

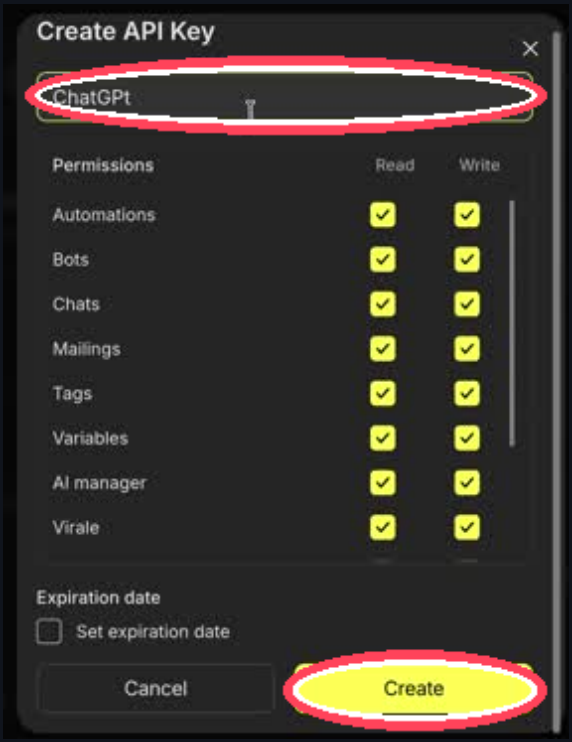

Create and save your key

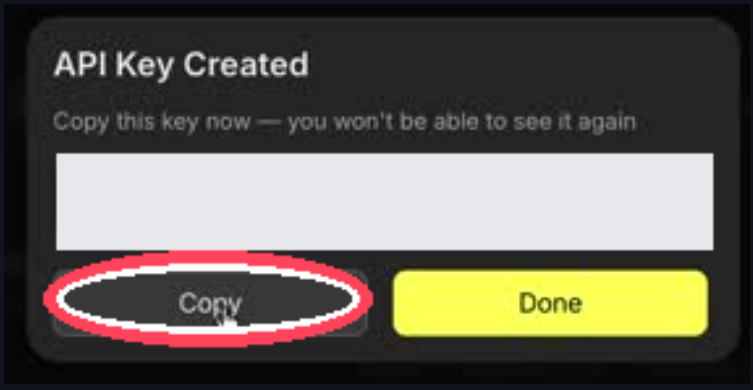

Keep the key private; the real key is hidden in this guide.

3. Name the key, choose the permissions you need, and click Create.

For analysis, use the relevant Read permissions. Write permissions allow changes. Do not enable every permission just to follow this tutorial.

4. Click Copy and save the key securely.

The recording shows Masha switching to Notes to save the key and returning later to copy it. Prefer a password manager or a locked note. Never share the key in comments or a normal AI chat message.

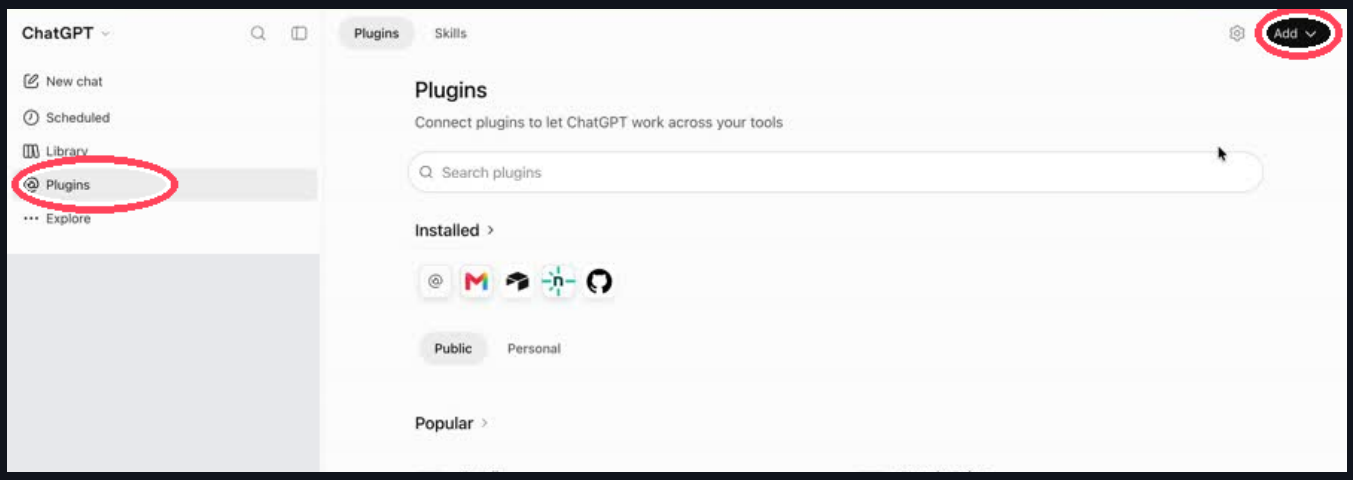

5. Return to the MCP page and copy the public server URL shown there:

https://mcp.chatplace.io/mcp

Add the ChatGPT connector

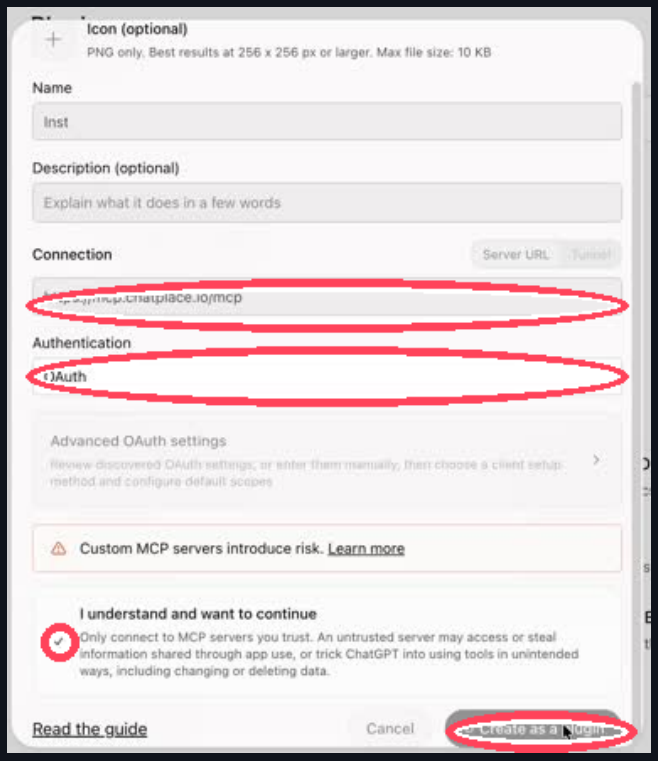

This page follows the Plugins interface shown in the recording.

6. In ChatGPT, open Plugins → Add → Add custom MCP server.

Some versions call this section Apps or Connectors. If custom MCP servers are unavailable, check your plan and workspace restrictions.

7. Enter a name, paste the server URL, and keep Authentication set to OAuth.

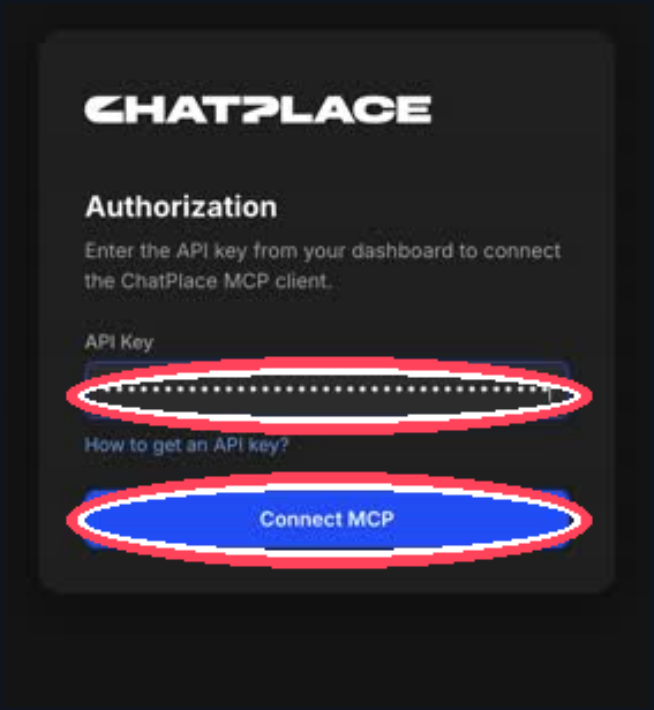

The circles mark Server URL, OAuth, the confirmation checkbox and Create as a plugin. Read the warning, confirm only if you agree, then create the plugin. Leave advanced OAuth fields unchanged unless your setup requires them.

Authorize and test

The final authorization happens on the ChatPlace page.

8. Click Connect MCP in the new plugin. On the ChatPlace page, paste your API key and click Connect MCP again to finish authorization.

In the video, Masha does not confirm the final step again because her account is already connected. For a first-time setup, you must complete authorization and wait for the result.

9. Return to your AI chat and enable the connector in the tools menu if your interface requires it. Try: “List my connected Instagram accounts and tell me which analytics you can access.”

Using Claude instead?

Open Customize → Connectors → Add custom connector, or the equivalent menu in your version. Enter a name and the same MCP URL, then complete ChatPlace authorization using your key. Other AI assistants need support for compatible remote MCP connectors.

Troubleshooting

Check the URL, key permissions, selected project and connector availability. If a key becomes public, revoke it in ChatPlace and create a new one. A connector does not automatically expose every Instagram Insights metric.

Your first analysis prompt

Copy this prompt and replace the fields in square brackets.

This is a starting request, not an activation code. Your connector and permissions determine which data is accessible.

Analyze my Instagram using the connected ChatPlace tools.

Account: @[YOUR_HANDLE]. Positioning and niche: [YOUR_TOPIC]. Target audience: [YOUR_AUDIENCE]. Goal and deadline: [YOUR_GOAL]. Filming and posting constraints: [YOUR_CONSTRAINTS].

1. Verify the connection and identify my account. State when the data was last updated, which metrics you can access, and any limitations. If the account is ambiguous, ask me to confirm it.

2. Analyze the last 30 days and compare them with the previous 30 days, if available. Review my latest 10-15 posts separately from historical hits. Do not present lifetime post views as views earned during a selected period.

3. Compare topics, formats, duration and opening hooks. Give 3-5 strong and weak examples with links and numbers. Use the median alongside the average so one viral post does not distort the picture.

4. Separate reach, engagement and follower acquisition. If follows per post, retention, saves, shares or Trial Reels data are unavailable, say so. Do not invent metrics or treat missing values as zero.

5. Check whether the service’s niche classification matches my positioning. If it does not, avoid irrelevant competitor benchmarks. Do not change settings.

6. Give five key findings, clearly separating facts from hypotheses. Propose a seven-day plan with a topic, hook, short script, goal and evaluation metric for each Reel. Explain what to repeat, test or stop scaling. Do not guarantee growth.

Use the connected tools rather than general advice alone. If access fails, explain the problem. Do not publish, send messages, change settings or start paid generations.
